

Composite Closure Programme

Combi-Twist® 63mm BTO

The 63mm BTO Combi-Twist® is a composite closure, which is produced in the USA.

It combines Twist-Off® and Plasti-Twist® technologies into a single closure system.

It is designed for cold and hot fill applications for plastic and glass containers, and has excellent barrier properties.

The 63mm BTO Combi-Twist® main characteristics:

Superior Sealing Performance

The closure incorporates a metal panel with plastisol gasket and a plastic fitment with tamper evident band. The gasket ensures an excellent sealing performance on all types of container.

Improved Tamper Evidence

The patented drop down safety band provides improved tamper evidence. The closure is available with or without a vacuum safety button. With this feature the button pops up with an audible click during first opening, when the vacuum is released. It provides a triple safety feature as you can see, feel and hear the change.

- The 63mm BTO Combi-Twist® is easy to open and to reseal.
- A multi-start 4 thread system ensures improved cap application and removal.
- The cap can be applied with straight-line belt or rotary sealing machines.
- There is a dud detection system, similar to metal closures.
- The plastic fitment is available in a variety of colours.
- The metal panel has the same litho print possibilities as regular metal PT and Twist-Off® closures.
