

Equipment & Service: Dud Detector

Silgan White Cap VAC

... is used for electronic vacuum testing directly after the capping process on cold fill lines or after re-cooling the product on hot fill lines.

Jars with insufficient or no vacuum are rejected after a defined period of time whilst the line speed remains constant.

This is an indispensable additional feature to optimise product and line safety.

Features:

- Contemporary, functional design
- Retrofitting counter function for reject and production quantity
- Simple set-up and adjustment
- Easy installation at a suitable point on an existing conveyor belt of the production line

Technical Information
